SENIOR TALENT ACQUISITION PARTNER | RECRUITING OPERATIONS PORTFOLIO

Brittany Larson

I built an Airtable-based recruiting system to replace the company's lack of a functional ATS, then layered Claude automations on top. The system centralizes candidate information, interviews, intake notes, and req activity, automates phone screen outreach and rejection emails, and gives hiring managers a single place to review candidates and provide feedback. I also led the rollout to the India recruiting team.

THE PROBLEM

The company had no valid ATS, so there was nowhere to keep candidates and interview information next to the rest of the req. Intake notes were scattered, the same details got typed into a tracker after every screen, candidate emails went out late or not at all, and hiring manager feedback sat in chat threads.

WHAT I BUILT

An ATS built in Airtable around how the team already recruits, with candidates, interviews, intake notes, and hiring manager input in one place. Claude fills in the records from the files I already create, and the routine candidate emails go out automatically. I stay on the work that needs judgment: sourcing, screening, and advising.

THE SYSTEM

Req Tracker (Airtable ATS)

Built because there was no ATS to store candidates and interview information. It's a linked database: reqs, candidates, intake calls, phone screens, interviews, and onboarding, plus a directory of hiring managers, HRBPs, and business units. The pipeline follows every candidate from application through hire, and an aging tracker flags reqs that have been open too long.

Airtable · Linked records · Formula fields

Claude Automations

Claude files intake calls, phone screens, job descriptions, and resumes into the right req folder, then writes the Airtable records. For each req it drafts a candidate pitch, a sourcing Boolean, and an intake follow-up email. Custom skills handle candidate submittals, the daily sync, and interview records built from my Outlook calendar.

Custom skills · Daily sync · Outlook calendar

Candidate Communication

Phone screen outreach and rejection emails are fully automated. Moving a candidate to the invite stage sends the phone screen invite with my booking link. Rejection emails go out on their own after a candidate is rejected, with separate wording for after a phone screen and after interviews. Each email sends once, replies come to me, and I'm copied. When a candidate accepts an offer, an onboarding record is created and the welcome email goes out.

Airtable automations · Send-once checks

Hiring Manager and HRBP Visibility

Each open req has its own hiring manager page showing submitted candidates, experience summaries, and resumes. Hiring managers record their decision and comments there instead of in Teams chat, so the reasoning stays with the candidate. Standard intake and phone screen forms capture every req the same way.

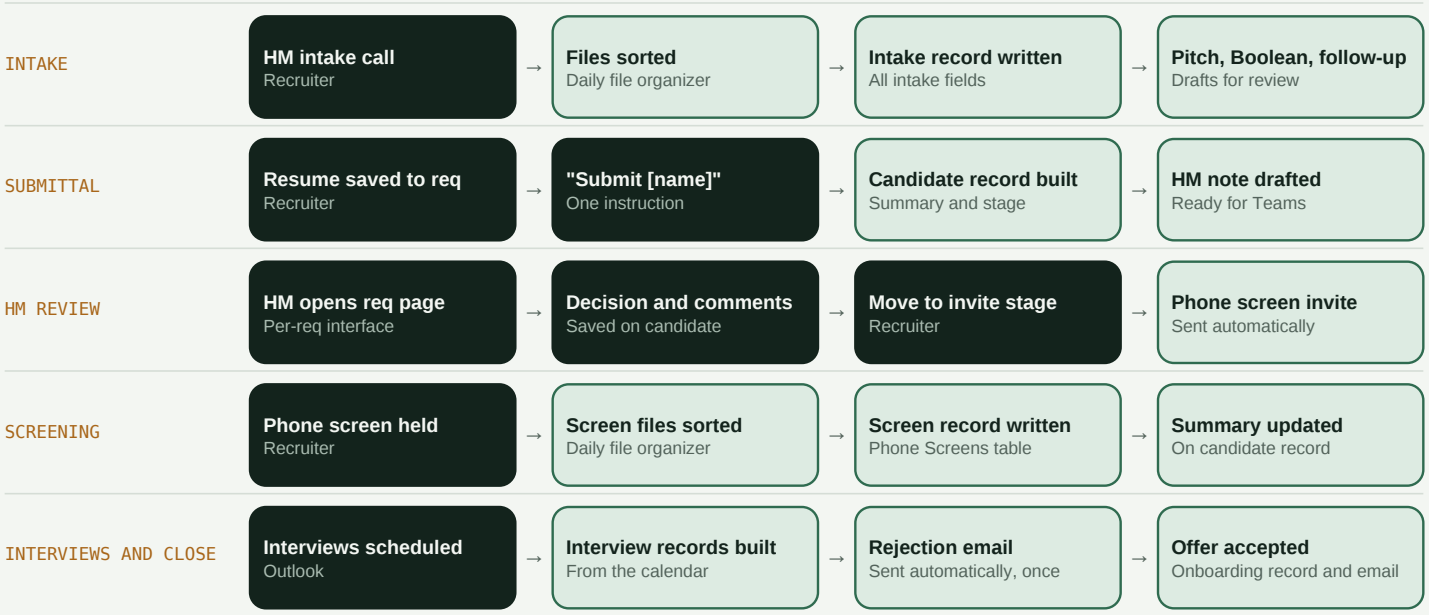

Airtable Interfaces · Standard forms

End-to-End Workflow

BRITTANY LARSON

From the intake call to the offer, where the work happens

Dark boxes: the recruiter or hiring manager does this. Light boxes: automated.

WHAT HIRING MANAGERS GET

- The same submittal format on every req, whatever the role.
- An experience summary written for that req, not a resume recap.
- Comp ask visible before the interview decision.
- Their decision and comments saved on the candidate record.

HOW I KEEP IT SAFE

- Claude drafts emails and calendar invites. It doesn't send them on its own.
- Every candidate email has a sent flag, so no one gets the same message twice.
- Rejection emails wait before sending, which leaves time to fix a wrong stage change.
- Before turning an automation on, I check which records it would act on. That check caught eight candidates who would have been emailed at once.
- The skills are set to stop and ask when something is unclear.

Bringing the system to the India recruiting team

I rolled the system out to the India recruiting team and their HRBPs. The rollout is complete.

1. ### Set up for India
   A dedicated India version of the tracker, adapted to how the India team already organizes its work.

2. ### Trained the recruiting team
   A series of enablement sessions on the tracker, the recruiting workflow, and how the Claude automation works day to day.

3. ### Aligned the HRBPs
   A walkthrough for HRBPs on hiring manager visibility and how the tracker changes the partnership between HRBPs and Talent Acquisition.

4. ### Documented the process
   A written implementation guide so the setup can be repeated.

SKILLS

• Recruiting process design • ATS design • AI workflow automation • Change management • Stakeholder enablement • Training and documentation • Cross-region rollout

TOOLS

• Airtable • Airtable Interfaces • Claude • Microsoft Outlook • Microsoft Teams
